SVAB Wheel Steering Kit on EW140-EW230

Steer your machine without ever letting go of the joystick!

What is SVAB Wheel Steering?

SVAB Wheel Steering means that you steer your excavator's wheels with a proportional roller in the joystick handle.

How do I use SVAB Wheel Steering?

Choose whether to use the proportional rollers in your joystick handle primarily for steering OR primarily tiltrotator with shift-in wheel steering. **Better yet, switch to SVAB Grip L8 and do BOTH at the same time!**

SVAB Grip L8, our functional designed joystick handle, allows operation of TWO functions at the same time in the same handle!

Why should I use SVAB Wheel Steering?

- **Increase your effectivity** – forever end constant shifting between handles for steering.
- **Improve ergonomics** – ease tedious steering with proportional roller steering.
- **Better precision** – combine proportional digging, moving and driving.
- **Improved workspace** – by tilting the steering wheel forward and out of the way.

What do I need to start using SVAB Wheel Steering?

All you need is a SVAB RT or GP System. If you are already using SVAB and want to also use wheel steering, you can easily upgrade your system.

Can I get SVAB Wheel Steering for MY machine?

SVAB has solutions for ALL machine makes and models!
